Self-Reflection

Completing the Computer Science Program has given me the opportunity to enhance my knowledge and skills. Throughout the program, I have demonstrated my growth in UI/UX, testing, and problem solving. The most important process that helped me was to understand the problems that needed to be addressed more than the code itself working. This helped me maintain my progress and track of the improvements I wanted to make on my project.

My strongest area in the development was the software design and engineering. Coming up the new look and overall functionality of the project was very appealing to me. I have always had a knack for design, and it really helped me with improving the project. I was able to put my knowledge of data structures to the test. I improved the validation and tests used in the project appropriate to the user inputs. Databases were interesting because they are still somewhat new to me. However, it was really fun learning how to expand their use. I also learned a lot about security and how to implement it in my project.
